

Claim the data a company holds on you — and check they actually gave it all.

THE PROBLEM

You get the email no one wants: “*your data was part of a breach.*” Laws like GDPR and CCPA give you the right to ask any company to show you the data they hold on you — or to delete it. But two things break in practice. Most people don’t know how to ask, who to contact, or what they’re even owed. And when a reply finally comes back, **nobody checks whether it’s complete**. A company can quietly leave things out, and today no one catches it.

OUR SOLUTION

DataProof is a simple web app that helps a person ask a company for their data, then checks the reply for them. You pick a company and a goal — *see my data* or *delete it*. The app finds the right contact, works out which law applies and what you’re owed, and writes the request in the correct words for you to send. When the company replies, you upload it — and the app reads the reply, compares it against what you were legally owed, and explains in plain language what’s missing or dodged.

Existing tools stop once the request is sent. We keep going — and check the company’s reply.

Knowing your rights is one thing. Knowing a company actually honored them is another — and that’s where people are left on their own today. **DataProof reads the reply and tells you whether you got everything you’re owed.**

WHY IT'S DIFFERENT

Not data-broker cleanup. Tools like Incogni and DeleteMe remove you from data-broker sites. DataProof works with the companies you actually use — and checks what they send back.

Not enterprise software. OneTrust and Transcend are built for the company side. DataProof stands on the person’s side.

Privacy by design. You stay in control: you send the request, you pass the company’s identity check, and the reply comes to you. The app only sees your data when you choose to share it — and never pretends to be you.

HOW WE'LL BUILD IT

Front-end — React / Next.js: the step-by-step screens

Back-end — Java / Spring Boot: runs the flow, talks to the AI

Intelligence — a reasoning LLM (Claude): works out your rights and powers the checker

Rules base — a curated set of GDPR & CCPA rules fed to the AI, so it reasons from real law, not guesses

Document reading — Apache Tika: clean text from PDF, CSV, or email replies

Contact finder — an AI web search to locate a company’s data-request contact

Database — PostgreSQL: tracks each request and its legal deadline
